TestBox is a next generation testing framework for ColdFusion (CFML) that is based on BDD (Behavior Driven Development) for providing a clean obvious syntax for writing tests. It contains not only a testing framework, runner, assertions and expectations library but also ships with MockBox for mocking and stubbing. It also supports xUnit style of testing and MXUnit compatibilities.

MockBox is a companion package to TestBox that will give you advanced mocking/stubbing capabilities; hence a Mocking Framework. You can use it from within TestBox or as a standalone package.
